

"Yehager Lij" App — Project Analysis

Status check only — no code changes made · Generated 2026-08-13

What This App Is

A **static front-end web app** — plain HTML/CSS/JavaScript, no framework, no backend, no database. It's a **creator/consultant booking marketplace** (similar in concept to Cameo/Fiverr): browse people by category → view a profile → book a "Message" or "Video Call" → see a confirmation screen. All "data" comes from one static file, `data/contacts.json` (10 sample profiles).

Current File Inventory (13 files)

Page	Script	Stylesheet
index.html (browse/list)	scripts/script.js	style.css
pages/main.html (profile detail)	scripts/main.js	styles/main.css
pages/booking.html (booking form)	scripts/booking.js	styles/booking.css
pages/confirmation.html (receipt)	scripts/confirmation.js	styles/confirmation.css

Plus `data/contacts.json` (the fake database) and the `img/` folder (profile photos + header art).

What Already Works

Browsing, category filter, search, sort, clicking into a profile, filling the booking form, and landing on a confirmation page that reads everything back from the URL query string. The core flow is coherent end-to-end for the happy path.

Bugs Found (verified in the code, not opinions)

- 1 Review form is dead code.** `scripts/main.js` defines `loaclstrog()` (the function that wires up the "Post Feedback" submit handler) but never calls it. Clicking "Post Feedback" currently does nothing.
- 2** Inside that same function, it *reads* localStorage key `'getInput'` but *writes* to `'getinput'` (different casing) — even once called, saved feedback could never be read back.
- 3** It stores the raw array (`getFeedBack`) instead of the JSON string already built (`feedbackString`) — would store `"[object Object]"` instead of real data.
- 4** Nothing ever renders saved reviews back onto the page — the `.comments` div is written into the HTML but never filled in by JS.
- 5** `pages/main.html` has two `.comments` elements (a `<p>` and a `<div>`) — leftover duplication from copy/paste.

6. **6 Header image is missing on every inner page.** `.headers` (the banner div) only has a background-image rule in `style.css` (used by `index.html`). `styles/main.css`, `booking.css`, `confirmation.css` never define `.headers` at all — so the banner renders blank on the profile/booking/confirmation pages.
7. **7 Category buttons don't cover all data.** Buttons are hardcoded to Business/Fitness/Technology/Marketing, but `contacts.json` also has Career, Design, Finance, Education profiles — those are only reachable via "All" or search, never via category filter.
8. **8 Booking date picker has a stale minimum.** `min="2026-07-03"` is hardcoded in the HTML and doesn't update with today's date — it's already in the past, so it won't stop someone from booking a past date.
9. **9 Nothing is actually saved anywhere.** "Confirm Booking" just forwards form values through the URL to `confirmation.html`. Refresh, close the tab, or lose the URL and the booking is gone — there's no booking history / "my bookings" anywhere.
10. **10 Confirmation page has no error handling.** If the `id` in the URL doesn't match any contact, `match` is `undefined` and `match.Name` throws — a blank broken page instead of a friendly message.
11. **11 "Login" link goes nowhere** (`href="#"`) on every page. No login page, no accounts, no session — even though a nav item promises it.
12. **12** Two different class names are used for the same nav bar concept: `.intro` on `index.html` vs `.head` everywhere else — inconsistent, makes shared styling harder to maintain.
13. **13** `styles/booking.css` is almost a full copy-paste of `styles/main.css` (same header/search/card rules duplicated) rather than a lean, page-specific sheet — any shared style change means editing 3 files by hand.
14. **14** Invalid tag casing `<div>...</div>` in `booking.html` (browsers tolerate it, but it's sloppy markup).
15. **15** Prices (`MessagePrice` / `CallPrice`) are shown throughout but there's no real payment step — currently cosmetic only.

What's Missing to Call It "Complete"

- **Persistence** — right now closing the tab erases every booking/review. Minimum fix without a backend: store bookings/reviews in `localStorage`. Real fix: an actual backend + database.
- **Auth** — the Login link needs either a real login/signup flow, or should be removed until it's built.
- **Reviews that actually save and display** — finish the wiring described in bugs #1–4, plus render existing reviews on load.
- **A "My Bookings" view** — so a booking isn't a one-time, disappears-after-refresh URL.
- **Payment integration** — or explicitly treat prices as informational only.
- **Error / empty states** — no contact found, empty search results, etc.

Scope: How Much Is Left

No new files needed for a solid static-only version — the 15 bugs above are all fixes inside the 13 files that already exist.

+2 to 4 new files if a real Login page is added (`pages/login.html` , `scripts/login.js` , maybe a shared `styles/auth.css`) and/or a "My Bookings" page.

A full backend (Node/Express + a real database) would be a much bigger jump — only worth it if real accounts and real payments are wanted instead of a portfolio-style demo.

Suggested Order of Work

1. Fix the review-form wiring (bugs #1–5)
2. Fix the missing header images on inner pages (bug #6)
3. Make category buttons dynamic, generated from the data instead of hardcoded (bug #7)
4. Add localStorage-based booking history (bug #9)
5. Add confirmation-page error handling (bug #10)
6. Decide on Login: build it for real, or remove the link (bug #11)
7. Consolidate the duplicated CSS between main/booking/confirmation stylesheets (bugs #12–13)
